

OPERANT CONDITIONING BEHAVIOR TEST PACKAGES FOR RAT

Med Associates offers more components for testing in rats than any other manufacturer. The following packages are just a few of the more common configurations that we have assembled over the years for rat operant testing. Feel free to custom design your own chamber configuration using any of these designs as your guide to meet virtually any research requirement. Additional items to consider include an audio generator, infusion pump, scrambled foot aversive stimulation, lickometer, movement detector, and constant current square wave stimulator. Each operant package for rat is a complete single test station including the SmartCtrl™ interface. This does not include the interface and software package that must be ordered separately.

Interface, computer and software are sold separately.
